

## 1. Explore Settings Tab

Explore and understand all the options currently available in the Settings tab, including:

Multiple browser support

Headless execution

Retry mechanism

Going through other settings

2. Implement LLM Configuration in Settings and ensure it is used during execution when test

Using the prompt to give instructions to VSCODE

Step 1: As a senior developer implement the LLM configuration logic into the Settings tab instead of the env file

Step 2: Ensure that the static UI available for the LLM configuration in the settings tab is replaced with the required functional implementation

Step 3: Review steps 1 and 2 and strictly ensure that the selected LLM configuration from the Settings tab in step 2 is used during execution.

## Now performing execution

You are using an unsupported command-line flag: --disable-blink-features=AutomationControlled. Stability and security will suffer. X

Validate the last front end execution is  
done using the set up in setings and  
confirm it

Live backend validation shows:

- Settings provider: `groq`
- Settings model: `openai/gpt-oss-120b`
- API key configured: yes
- Execution client provider/model: matching
- Client ready: `true`
- LLM configured: `true`

The frontend build and backend build also pass. I fixed provider-name normalization so Settings values are correctly recognized by the LLM client factory.

Note: this confirms the current configuration used by new executions. The earlier execution occurred before the normalization fix and cannot be retroactively verified as using the LLM.

The frontend process is running in the background. I'm checking the Vite port now so I can confirm the actual listening URL rather than assuming startup succeeded.

```
Ran $response = Invoke-WebRequest -Uri  
'http://localho...
```

Frontend server restarted successfully and is available at:

<http://localhost:5173/>

localhost:5173/execution

### Evidence:

- Execution started: 2026-09-10T15:11:20Z
- Settings configuration: provider `groq`, model `openai/gpt-oss-120b`
- During that execution, the logs show three successful LLM locator calls for `Username`, `Password`, and `Login`.
- Each call received an LLM response and resolved the locator successfully:  
`app.log:4940-4985`
- The execution completed successfully with all 4 steps passed.

The logs do not record the provider/model on each individual request, but the runtime client was configured from the Settings values before execution, and the LLM calls succeeded using that client.

### 3. Support Plain English as Input

Using the prompt through VS code to update the input to support plain English instead of taking the input from the feature editor from the front end tool for execution.

Running...

Navigate to the LeafTaps application url :"https://leafTaps.com/opentaps/control/login"

Enter the username "Democr2".

Enter the password "crmsfa".

Click the Login button.

### Instructions

The configured LLM converts these instructions into executable browser steps when you run the test.

Include the target page, user actions, values, and expected results.
